Implement Client Script & UI Policy (Incident)

Milestone 5: Create onCellEdit Client Scrip

Activity 1: Create Client Script

1. **Navigate to Client Scripts:**
   Go to System UI → Client Scripts in your ServiceNow instance.

2. **Click New** to create a new Client Script.

3. **Fill in the details:**

- **Name:** Prevent state change via list edit – clearly indicates that the script prevents users from changing the State field directly in a list.

- **Table:** Incident – applies the script only to Incident records.

- **Type:** onCellEdit – runs whenever a field is edited directly in a list view.

- **Field name:** State – the script will monitor changes to the State field.

- **Active:** true – ensures the script is enforced immediately.

4. **Paste the script** into the script editor section. The script should prevent unauthorized changes to the State field when editing from the list view.

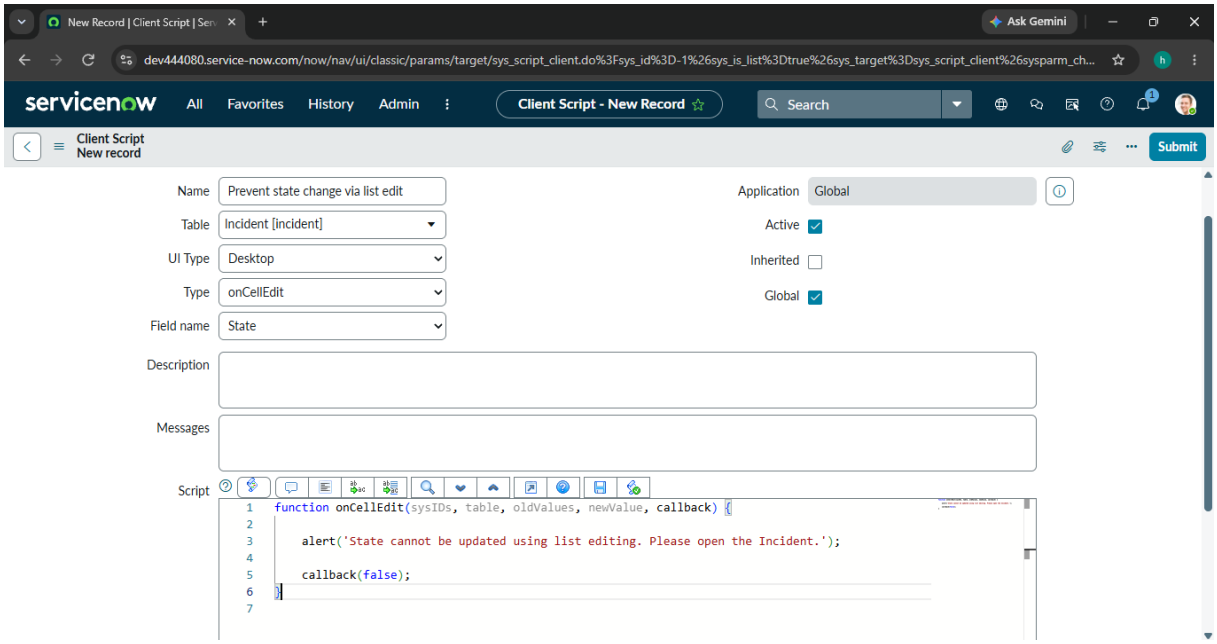

```
function onCellEdit(sysIDs, table, oldValues, newValue, callback) {

  alert('State cannot be updated using list editing. Please open the Incident.');

  callback(false);
}
```

5. **Click Submit** to save the Client Script.

6. **Verify:** Open an Incident list and try to change the State field directly in the list. The script should block the change as intended.
7. Click **Submit**.
